

ABSTRACT OF THE DISCLOSURE

In a liquid supplying member, for supplying liquid from a liquid container to a liquid ejection head which are provided in a liquid ejection apparatus, a plurality of elastic members, each of which is elongated in a first direction so as to have a first face and a second face, are arrayed in a second direction perpendicular to the first direction. A first film member is joined to the first face of each of the elastic members. A second film member is joined to the second face of each of the elastic members, such that a passage, through which the liquid is supplied from the liquid container to the liquid ejection head, extending in the first direction is hermetically defined between the adjacent elastic members by inner faces of the first film member and the second film member.
